Boom Lifts

Boom lifts are equipment that has a platform that may be lowered or raised to various heights, hence making this piece of equipment an important necessity in a wide variety of professions. Accessible in several particular types such as aerial lifts, scissor platform lifts, and knuckle boom lifts, each model operates very specifically.

Aerial platform lifts are most commonly used to carry people at ski lodges who are not comfortable with a snowboard lift. These platform lifts function much like an elevator, skiers may be slowly but surely shuffled up the mountain, stopping at stations along the route until they arrive at the top. Aerial hoists are also used in construction, moving workers safely up and down the sides of multi-level building sites.

Scissor jacks are also in the boom jack class. They are utilized frequently by service providers as an idyllic way to allow personnel to complete maintenance and repair on wires and cables that are attached to poles. Phone, cable and power corporations have relied on the effectiveness of this type of boom lift for years.

The knuckle boom jack is made for use within locations of uneven terrain and where the need to reverse course may be necessary. This type of boom jack has the capability to fit in tight spots where a scissor jack cannot fit. Working amid multiple equipment in a production plant or in near proximity between two walls, the knuckle boom also features a standard platform outfitted with rails for protection and employee safety.

Depending on the work requirements and the kind of job to be completed will ascertain the proper type of boom lift to pick. Fortunately, there is a version suitable for nearly any application.
