Vancouver Wheel Loader Training

Vancouver Wheel Loader Training - The two most common kinds of heavy equipment training are classed into the categories of equipment; machinery that is fashioned with tracks and those with rubber tires. The tracked vehicle are heavy duty machinery like for example cranes, bulldozers and cranes. They make up the most common type of heavy equipment training. Typically, the rubber tire training involves the rubber-tired kinds of end loaders, cranes and earth movers. Heavy equipment training also includes making use of various rubber-tired vehicles such as scrapers, dump trucks and graders. Training centers often offer truck driver training for the different kinds of heavy equipment training.

The majority of all heavy machinery operates on diesel fuel and as such, the basics of diesel mechanics are a major part of heavy equipment training. Often, a basic program on diesel mechanics is typically required of those training. Among the main objectives of the course are to educate an operator on basic troubleshooting and maintenance procedures in the event of a problem with the machinery. Normally, this training saves a mechanic from being called out in the middle of the night just because a piece of machinery requires the addition of something minor such as engine oil. Diesel mechanics for heavy machinery is an education all unto its own; thus, extensive training is not often included in the course book for the general training course.
